

How much do I need?

A rule of thumb is one yard to cover 100 square feet 3", so the 2nd best way to guess how much you need is to walk around the yard with a notepad and measure the individual beds, squaring them off into approximate rectangles, then adding up the total square feet, if you come up with 1200, get 12 yards. (if you want 3" depth).

The best way is to learn from experience, call us to see what you used last time, and make adjustments as needed. Keep in mind that it's ok to be a little under or over 3", so take advantage of volume discounts if possible, or maybe even plan your mulching schedule to meet minimum delivery load sizes.
